ABSTRACT

Criminal record generally contains personal information about particular person along with photograph. To identify any Criminal we need some identification regarding person, which are given by eyewitness. In most cases the quality and resolution of the recorded image segments is poor and hard to identify a face. To overcome this sort of problem we are developing software. Identification can be done in many ways like finger print, eyes, DNA etc. One of the applications is face identification. The face is our primary focus of attention in social interactions playing a major role in conveying identity and emotion. Although the ability to infer intelligence or character from facial appearance is suspect, the human ability to recognize face is remarkable.

INTRODUCTION

This project is aimed to identify the criminals in any investigation department. Here the technique is we already store some images of the criminals in our database along with his details and that images are segmented into many slices say eyes, hairs, lips, nose, etc. These images are again stored in another database record so to identify any criminals; eyewitnesses will see the images or slices that appear on the screen by using it we develop the face, which may or may not be matched with our images. If any image is matched up to 99% then we predict that he is only the criminal. Thus using this project it provides a very friendly environment for both operator and eyewitness to easily design any face can identify criminals very easy.

HARDWARE REQUIREMENTS:

- System configuration
Processor : Pentium III-900 MHZ
Hard disk : 20GB
RAM: 128 MB

SOFTWARE REQUIREMENTS:

Operating system: Windows

Graphical user interface: Java swing -AWT.

Application logic: Java 7

Database : Oracle 10g

IDE/Workbench : My Eclipse 6.0

Code:

```
package criminal.project;  
  
import criminal.project.IN;  
  
import criminal.project.ABT;
```

```
/*
